PVC Tufted Mats

Vinyl backed mats are cut on sophisticated computerised automatic cutting machines ensuring immaculate clean - cut sides resistant fraying and unravelling. Vinyl backing increases durability and makes mat antiskid. Backing also ensures that dust and dirt remain trapped in the mat making it easy to clean. In these door mats we can print beautiful designs as per your requirements

Rubber Mats

- (a) Rubber Pin Mats: Non slip back or colored rubber mat with small pins are economical as well as durable and easy to clean. Thousands of flexible but durable bristles scrape the mud off the bottom of shoes and boots.
- (b) Rubber Iron Mats: These iron mats are made by moulding natural rubber and looks like traditional cast iron mats. They combine elegance with durability and are easy to clean. The openings in the mats effectively trap dirt making life easier for your interiors.
- (c) Rubber Grill Mats: Moulded rubber mats with an outer rubber iron scroll border. These mats are tough and built to last. The rubber backing collects dirt and rubber border and beautiful prints inside adds a classic touch to the mat
- (d) Hollow Mats & Step Mats: Non slip rubber mat with open circular or hexagonal pattern either 16 mm or 22 mm thickness. Used as exterior doormat, safety and anti fatigue matting. Step or stair mats are lengthy mats and can be used for stairs.

Geotextiles

Redamation of Mine Spoils

Slope Protection

Here coir is the sure winner. Experimental studies have proved that while cotton and jute degrade within six months, coir geotextiles provide good support on slopes for about 5 years. It is resistant to saline water. Its greatest advantage is that it provides an ecological niche for a rapid re-establishment of the vegetation cover. Coir resembles natural soil in its capacity to absorb solar radiation. This means that there is no risk of excessive heating as happens sometimes in the case of synthetics.

All these experiments were successful and coir geotextiles were identified as ideal material for preventing soil erosion. Recently geotextile applications were successfully carried out for the protection of mud-bunds in the water-logged Kuttanad in Kerala India.

Wherever the earth is denuded of vegetation, some sort of covering has to be provided to prevent soil erosion due to rain or wind. This cover is called geotextile. In the early periods reeds, bamboo, wood and animal hide were used to bind soil. Now synthetic materials like polyester, polyamide and polypropylene are mainly used as geotextiles for civil engineering applications. The share of natural geotextiles is a mere 5% in the market.

In an age of growing environmental awareness, synthetic geotextiles have some disadvantages. Since the synthetic geotextiles are not biodegradable, they cause soil pollution. Further, their production processes cause air and water pollution. Hence the search for a suitable natural geotextile.

ADVANTAGES OF OUR PRODUCTS

- Our products are eco-friendly .
- Our products healthier and safer for you and our planet.
- Our products allow the body and conscience feel good.
- We offer varieties of designs and sizes.
- Our products are made of natural material – coir is the fiber between the two layers of a coconut's shells.
- Minimal processing: - Our products undergo very little. Processing and forego the usage of chemicals and expensive, timely and energy consuming processes.
- Durable : - Our products are extremely durable, the hard materials will with stand the wear and tear of daily usage, they are very easy to clean.
- Affordable : coir products are cheaper and beautiful compared to conventional products.
- Superior quality : we are specialists in superior quality products.
- We are very friendly and professional – it is easy to do business with us.
